Task 2:

1. A unit testing framework I found is called "pytest". This seems to be very similar to unittest in the way that it functions, so I feel I would be able to write tests for my calculator app.
2. The only difference I found between pytest and unittest is just a syntax difference when it comes to asserting the test. In pytest, I would have to write the calculator test like this:
`assert calc(5,10) == (15,-5,50,0.5)`
